FEATURES

- Two independent differential 2:1 multiplexers
- Guaranteed AC performance over temperature and voltage:
  - DC-to >10.7Gbps data rate throughput
  - <290ps IN-to-Out t_{pd}
  - <70ps t_r / t_f times
- Unique, patent-pending input isolation design minimizes crosstalk
- Ultra-low jitter design:
  - <1ps$_{RMS}$ random jitter
  - <10ps$_{PP}$ deterministic jitter
  - <10ps$_{PP}$ total jitter (clock)
  - <0.7ps$_{RMS}$ crosstalk-induced jitter
- Unique, patent-pending 50ý input termination and VT pin accepts DC-coupled and AC-coupled inputs (CML, LVDS, PECL)
- Typical 400mV CML output swing (R_L = 50ý)
- Internal 50ý input termination
- Power supply 2.5V ±5% or 3.3V ±10%
- –40°C to +85°C temperature range
- Available in 32-pin (5mm ∞ 5mm) MLF® package

APPLICATIONS

- Data communication systems
- All SONET OC3-OC-768 applications
- All Fibre Channel applications
- All GigE applications

Precision Edge®

DESCRIPTION

The SY58025U features two ultra-fast, low jitter 2:1 differential muxes with a guaranteed maximum data or clock throughput of 10.7Gbps or 7GHz, respectively.

The SY58025U differential inputs include a unique, internal termination design that allows access to the termination network through a VT pin. The device easily interfaces to different logic standards, both AC- and DC-coupled, without external resistor-bias and termination networks. The result is a clean, stub-free, low jitter interface solution. The differential CML output is optimized for 50ý environments with internal 50ý source termination and a 400mV output swing.

The SY58025U operates from a 2.5V or 3.3V supply and is guaranteed over the full industrial temperature range (–40°C to +85°C). The SY58025U is part of Micrel's Precision Edge® product family.

All support documentation can be found on Micrel's web site at www.micrel.com.

Notes:

1. Contact factory for die availability. Dice are guaranteed at T_A = 25°C, DC electricals only.
2. Tape and Reel.
3. Pb-Free package recommended for new designs.

PIN DESCRIPTION

Pin Number	Pin Name	Pin Function
25, 28, 29, 32, 1, 4, 5, 8	INA0, /INA0, INA1, /INA1, INB0, /INB0, INB1, /INB1	Differential Inputs: These input pairs are the differential signal inputs to the device. Inputs accept AC- or DC-coupled differential signals as small as 100mV. Each pin of a pair internally terminates to a V_T pin through 50ý. Note that these inputs will default to an indeterminate state if left open. Unused differential input pairs can be terminated by connecting one input to V_{CC} and the complementary input to GND through a 1ký resistor. The VT pin is to be left open in this configuration. Please refer to the “Input Interface Applications” section for more details.
26, 30, 2, 6	VTA0 , VTA1, VTB0, VTB1	Input Termination Center-Tap: Each side of the differential input pair, terminates to a VT pin. Each V_T pin provides a center-tap to a termination network for maximum interface flexibility. See “Input Interface Applications” section for more details.
18, 15	SELA, SELB	Bank A, Bank B Input Channel Select (TTL/CMOS): These TTL/CMOS-compatible inputs select the inputs to the multiplexers. These inputs are internally connected to a 25ký pull-up resistor and will default to a logic HIGH state if left open. Input switching threshold is V_{CC}/2.
27, 31, 3, 7	VREF-ACA0, VREF-ACA1, VREF-ACB0, VREF-ACB1	Reference Output Voltage: These outputs bias to V_{CC} –1.2V. Connect to the VT pin when AC-coupling the data inputs. Bypass with 0.01µF low ESR capacitor to V_{CC}. Maximum current source or sink is 0.5mA. See “Input Interface Applications” section.
10, 13, 16, 17, 20, 23	VCC	Positive Power Supply: Bypass with 0.1µF™Ó0.01µF low ESR capacitors.
22, 21, 12, 11	QA, /QA, QB, /QB	Differential CML Outputs: MUX A and MUX B selected CML outputs. See “Output Interface Applications” section for termination. Refer to the “Truth Table” for logic operation.
9, 24	GND, Exposed pad	Ground: Ground pin and exposed pad must be connected to the same ground plane.
14, 19	NC	Not connected.

Notes:

1. Permanent device damage may occur if the ratings in “Absolute Maximum Ratings” section are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Due to the limited drive capability, use for input of the same package only.
4. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device’s most negative potential (GND) on the PCB. Ψ_{JB} uses 4-layer θ_{JA} in still air unless otherwise stated.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6. Includes current through internal 50ý pull-ups. See Figure 1b.
7. V_{IH} (min) not lower than 1.2V.

CML OUTPUT DC ELECTRICAL CHARACTERISTICS[7]

V_{CC} = 2.5V ±5% or 3.3V ±10%; T_A = –40°C to +85°C; R_L = 100ý across each output pair, or equivalent, unless otherwise stated.

Notes:

8. High-speed AC parameters are guaranteed by design and characterization. V_{IN} swing ž 100mV unless otherwise noted.
9. Input-to-input skew is the difference in time between two inputs to the output within a bank.
10. Bank-to-bank skew is the difference in time from input to the output between bank.
11. Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
12. Random jitter is measured with a K28.7 comma detect character pattern, measured at 10.7Gbps and 2.5Gbps/3.2Gbps.
13. Deterministic jitter is measured at 2.5Gbps/3.2Gbps, with both K28.5 and 2^{23}–1 PRBS pattern
14. Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles, T_n–T_{n-1} where T is the time between rising edges of the output signal.
15. Total jitter definition: with an ideal clock input of frequency - f_{MAX}, no more than one output edge in 10^{12} output edges will deviate by more than the specified peak-to-peak jitter value.
16. Crosstalk is measured at the output while applying two similar frequencies that are asynchronous with respect to each other at the inputs.
