SERIES REGULATOR WITH RESET FUNCTION

■ GENERAL DESCRIPTION

The **NJM78LR05** is a series regulator with reset function.

In case of shut down or output voltage drop, the IC generates reset signal to a microcomputer.

That is suitable for items with microcomputer, such as TV sets, remote controller, refrigerator and others.

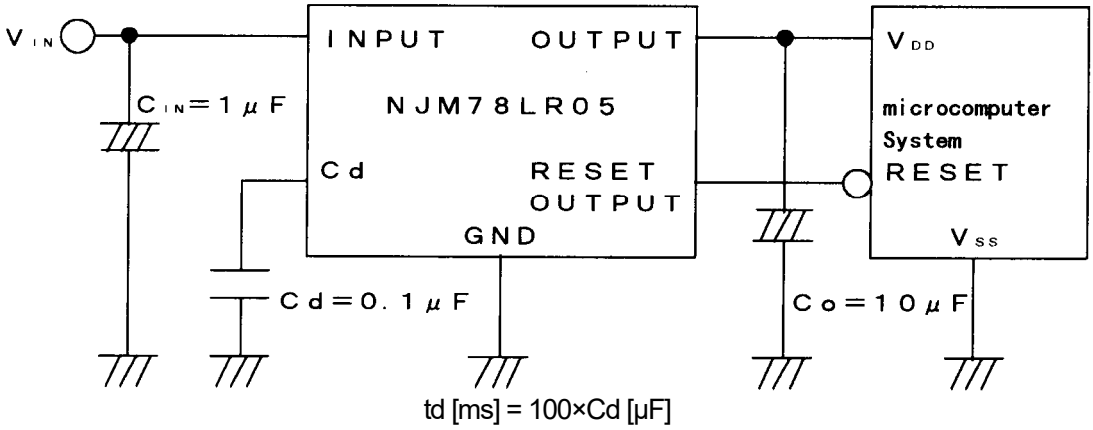
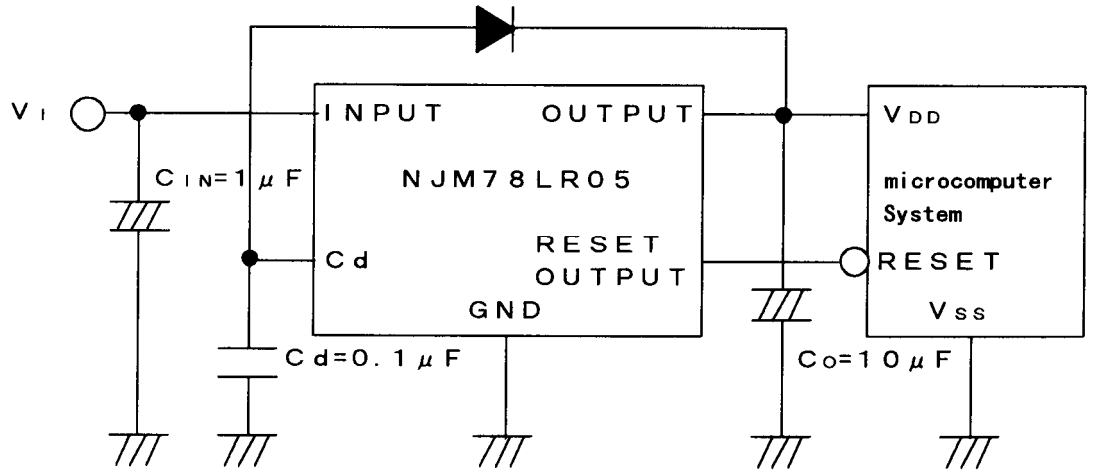
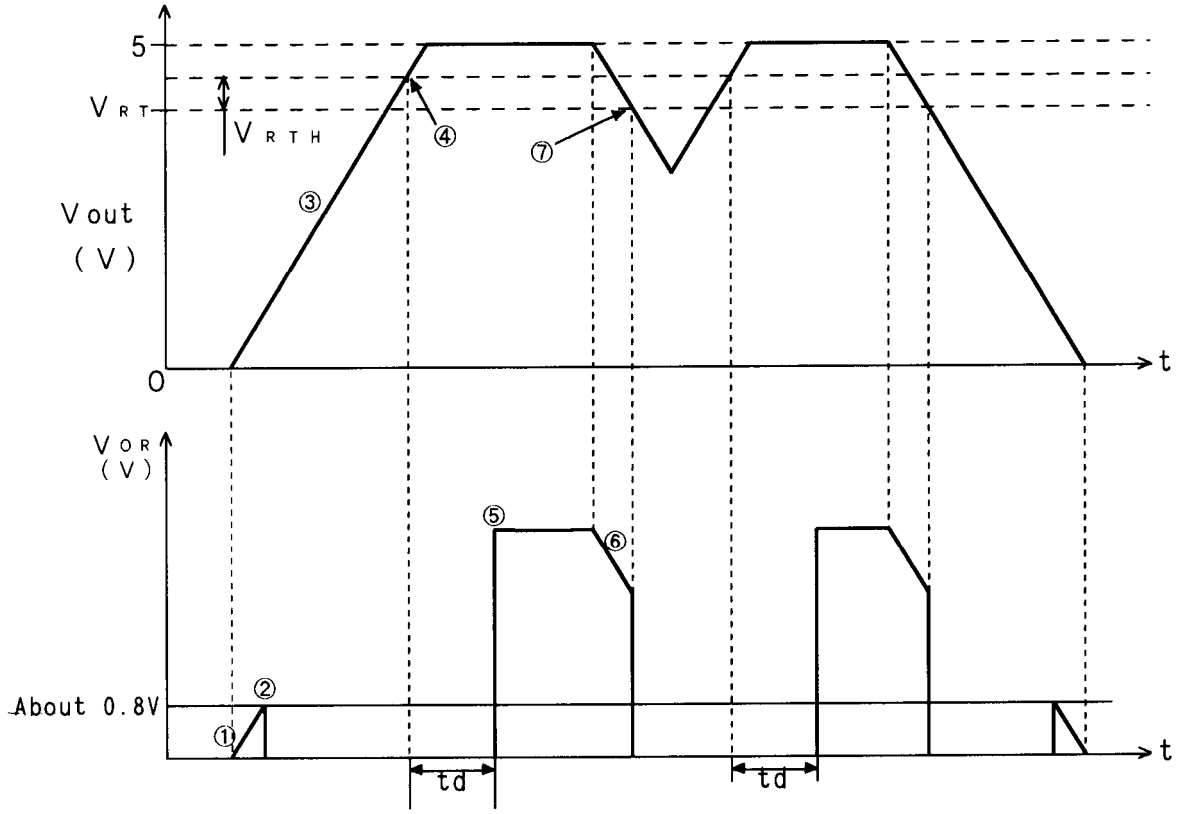
■ APPLICATION CIRCUIT



Note 1 : When the capacitance Cd is too large, the actual delay time is shorter than the calculated result because an electrical charge of Cd is discharged incompletely.
Solution of above problem :
(1) Connect SBD between output terminal and Cd terminal. Please refer to the fallowing circuit.
(2) Select larger capacitance, C_{IN} than Cd.



■ TIMING CHART



①When the input voltage is up to about 0.8V, some voltage is outputted at the reset output because the **NJM78LR05** operation is unstable.

②When the input voltage goes over about 0.8V, the reset output becomes “L”.

③The output voltage is rising up with the input voltage.

④When the output voltage goes over (V_{RT}+V_{RTH}), the delay circuit of reset output activates.

V_{RT} : Reset Threshold Voltage

V_{RTH} : Reset Threshold Hysterisis Voltage

⑤After the reset output delay time td has passed, the reset output becomes “H”.

⑥The output voltage is falling down with the input voltage.

⑦When the output voltage is less than V_{RT}, the reset output becomes “L”.
